### **WISKA presents new cable glands for special applications**

**Kaltenkirchen, 29 April 2009 – Within its SPRINT cable gland system, WISKA presented new cable glands for special applications at Hannovermesse.**

One of the attractive WISKA highlights is the breathing VentGLAND which due to an integrated Gore membrane reduces condensation water to a minimum. Now, its new polyamide versions in M25 and M32 also serve bigger enclosures. Doing so, it does not need any further components or installations. In terms of larger cable diameters, WISKA expands its portfolio of metal cable glands by the size of M75 which, according to an official manufacturer's declaration, will be very helpful for industries such as wind energy or shipbuilding. Also for hazardous areas and low temperatures until -60°C, WISKA now offers even more products: All cable glands of polyamide and brass until -60°C are now available as explosion-proof versions, all NPT thread versions also for low temperatures and its brass version for hazardous areas as well. Last but not least, the SPRINT System meets now also the requirements of IP69 K and is the optimum solution in terms of an efficient installation and lower storage costs. Within the over 20 years successful system, all cable glands, no matter what material, have identical clamping ranges and therefore, use a common range of sealing inserts.

Not only the new products but also the 90 years jubilee of WISKA brought many enthusiastic visitors to the company's stand at Hannovermesse. "Our origin is shipbuilding, but already in the late 1920s, we launched the first polyamide cable gland. Since then, we have steadily expanded our portfolio and developed new products. Still today, WISKA stands for quality, farsightedness and innovation – and with our development and production in Germany, also in our third generation we are well prepared for the future.", says Ronald Hoppmann, General Manager of WISKA.
